

SOP for Root Cause Analysis

- a. Identify the problem, define the problem. Know the question you are answering, define very closely what the question is
 - i. E.g: How to get a consistent number of Meetings? What is stopping that?
 - ii. Define how can we determine a good week?
 1. A good amount of meetings scheduled and completed
 2. High DM ratio for a campaign
 - b. Find the dashboard from where you can get the data (Data should be standardized meaning per resource)
 - i. Weekly Performance Analysis (Root Cause)
 - c. Be an objective observer and observe data and compare data when things were going good to when it got wrong
 - i. Bad week: 4/21 - 4/26
 - ii. Good week: 4/27 - 5/3
 - iii. Take the latest week as baseline data and use other weeks where meetings were consistent
 - iv. Baseline rows: 9, 10 and 11
 - v. Comparing row 12 with baseline row 11
 - d. Find out what the variance is, what's the difference and get to the root cause and ask WHY at every step. When you get down to the point where you cannot define reason from your data then write down 3 to 5 possible reasons that you can think of and ask WHY e.g: Less number of Calls.
 - e. At the end, you should be able to write down this is the cause to that problem and this is what we will do to solve this problem
2. If you come out of the dataset and you are confused then that's a problem
 3. If you think you have figured out but you have identified more problem that is still a success
